ACUTE ORAL TOXICITY OF 1,496 CHEMICALS
FORCE-FED TO CARP

By

Howard A. Loeb
Senior Aquatic Biologist

and

William H. Kelly
Conservation Biologist

The carp (Cyprinus carpio), introduced into North America in the nineteenth century, has become so undesirably numerous in many waters as to suggest control for the best interests of game fish resources or best water quality. For the most part the areas concerned are large so that complete eradication of carp would be very difficult, and the destruction of other fish by nonselective chemical treatment would make this method dangerous and costly. Research on selective methods of chemical control seems desirable. The selective feeding habits of carp are favorable to the development of a poison bait technique. A preliminary step toward development of such a technique has been the screening of large numbers of chemicals for their effect on carp when force-fed to fish held in large aquariums at the Fish Laboratory at DeBruce (near Livingston Manor, N.Y.).

Precedent for the discovery of a suitable poison to be incorporated into bait for carp has been established by the development of many chemical pest control devices. Hundreds of chemicals are now used extensively against such pests as insects, mites, nematodes, and rodents. Most of them are nonselective, i.e., they act against many besides the target species. Development of safer, selective poisons has been difficult.

The subject of toxicity, selective or otherwise, is very large and involves all life

forms from viruses to the larger species of animals and plants. A vast and growing literature encompasses efforts in the medical and agricultural fields, but this is not true of fisheries, where chemical work has been relatively limited.

Nevertheless, several extensive screening programs have been carried out as, for example, the attempt to find chemicals that would selectively kill oyster enemies and the successful efforts to find a selective chemical that would act at certain levels only against sea lamprey larvae (Applegate et al, 1957). In addition, a number of insecticides have been employed successfully in fishery work, and these have largely been general in effect.

The screening method of search for effective compounds is often the most practical available today, but in the future chemicals may be discovered in a more efficient manner, as outlined by Adams (1959): "Comparative biochemistry is, of all branches of science, the one that holds the master key for logical discovery of selective toxic agents. It can reveal metabolic differences between the economic species which man wishes to save and the uneconomic species which he wishes to destroy. Once these metabolic peculiarities are discovered the next step is to devise selective agents which can use them to cause irreparable damage to the uneconomic species. Unfortunately, comparative biochemistry has so far

attracted few workers although so much of selective toxicity is actually applied comparative biochemistry."

The program of screening compounds for use in a carp bait encountered the usual difficulties. None of the 1,496 chemicals reported on here proved suitable for incorporation into a bait (on a solubility-palatability basis), but the force-feeding tests do provide the only extensive acute oral toxicity data on fish available today. Accordingly the authors hope that others will find this material useful as a reference for future studies.

DEVELOPMENT OF EXPERIMENTAL MATERIALS AND TECHNIQUES

A laboratory was constructed and simple techniques for capturing and holding carp, obtaining chemicals, force-feeding, and tagging were devised before force-feeding could be undertaken.

The Fish Laboratory is located below a clear, continuously flowing, constant-temperature (47°F) spring with a capacity of 50 to 100 gallons of water per minute. The water, of pH 6.7, contains 10 p.p.m. of alkalinity and traces of other compounds and elements. It is fed into large tanks by gravity through nontoxic, black-iron pipes.

The carp were held and observed in 13 glass-fronted, fiberglass tanks (Loeb, 1959) of 350 and 550 gallons capacity. Each tank is independently maintained at any desired temperature by stainless-steel or aluminum coils connected to a closed-circuit oil-burning system and controlled by a solenoid and thermostat. The tanks are nontoxic to fish and other forms of life and require no maintenance.

The test carp were captured with an alternating-current electric boat shocker in the New York State Barge Canal. After transportation to the laboratory by tank truck supplied with oxygen, they were held for weeks at spring temperature of 47°F. The fish ranged from 1 to 10 pounds in weight but averaged around 3 pounds. Poor-quality fish were rejected.

The compounds force-fed to the fish were solicited from governmental, educational, and private agencies (table 3). Since it was impossible to accurately predict the effect of individual chemicals on carp, the majority of compounds were picked by the agencies in random fashion, and a great variety was received. All of the compounds reported on were accompanied by chemical names, many of which were changed to conform to the Chemical Abstracts system. A number also have trivial or trade names, listed in table 2.

Development of a method of force-feeding proved to be difficult, but the final technique (Loeb and Kelly, 1960) was completely adequate. For many fish, force-feeding is relatively simple because direct access to the stomach may be had through the pharynx. Carp, however, possess pharyngeal teeth which form an effective barrier to an ordinary probe. Accordingly a machined aluminum tube was developed in a shape which allowed it to be forced past the grinding mill formed by the pharyngeal teeth and the basi-occipital bone and into the thin-walled esophagus where the capsules containing the poison were deposited. A fiber glass rod was used as a plunger. The technique is an art but properly performed is almost always successful.

During the force-feeding operation the carp were immobilized in a nose-up position by a specially constructed device employing foam-rubber jaws and activated by compressed air (Kelly, 1959).

The force-fed fish were marked on the jaw or fins with brightly colored, paper laundry tags (Kelly and Loeb, 1959) or with colored thread tied to the serrated dorsal and anal spines.

The chemicals to be tested were placed in one or two No. 5 gelatin capsules by means of an eyedropper or drawn glass funnel.

SCREENING PROCEDURE

The basic objective of the force-feeding program was to discover compounds that were lethal at low doses of 30 milligrams or less of

compound per kilogram of body weight. Accordingly, all compounds were, if possible, force-fed at a much higher initial dose, and thus the need for further testing of most of them was eliminated. Lethal compounds were retested at lower doses.

Each chemical, in the gelatin capsules, was force-fed initially to three fish. Additional tests employed many more fish. The test fish were removed from 47°F water, force-fed, tagged, and placed in 65°F running water for observation. They quickly adjusted to this temperature and sometimes attempted to feed immediately.

Dissection showed that gelatin capsules in these fish held at 65°F disintegrated in approximately 1 hour. That time would be required before the chemical could come into contact with the intestine (this would be true for most chemicals; several chemicals appeared to react with the capsule and possibly contacted the intestine more quickly). Therefore as a general rule 1 hour should be deducted from the time to effect in table 1.

Fish that had been force-fed with one chemical were often held with fish that contained other chemicals. This mixing method was considered to be suitable under the circumstances, since interesting chemicals were retested on isolated fish.

A few early tests were run for only 24 hours, but the minimum period for almost all was 40 hours or more. Many fish were observed for a number of days.

Judging of effect was visual. If a fish acted or looked other than normal it was considered to be sick. If no movement occurred it was recorded as dead. Symptoms were noted, and special attention was paid to possible positive directional movements.

In table 1 the symbol for "less than" (<) is used often to represent sickness, recovery, or death occurring before the time of observation. The symbol for "more than" (>) is used occasionally to represent doses where exact data are for one reason or another lacking.

DISCUSSION OF TOXICITY AND SYMPTOMS OF TOXICITY

That a detailed analysis of the relative toxicity of compounds and groups of compounds tested would be meaningless will become apparent if table 1 is carefully examined. It appears that the toxic compounds in different groups affected fish without rhyme or reason. This is not entirely true since some groups included many toxic compounds while others contained very few. There are physiological reasons for effect or lack of effect of compounds on fish but these are little known. So far the attempt to relate toxicity to molecular mechanisms has succeeded in only a few cases (Adams, 1959). These few include determination of the effects of carbon monoxide, cyanide, the reversible anticholinesterase poisons physostigmine and neostigmine, the irreversible organic phosphates isopropylfluorophosphate (DFP), tetraethylpyrophosphate (TEPP), and others, the protein secreted by the botulinus bacillus which disrupts the acetylcholine cycle, and flouroacetic acid which interferes with the citric acid cycle. Nevertheless, the metabolic targets of most compounds remain uncertain, and most common poisons such as nicotine and arsenic are incompletely understood. Therefore results of the tests presented in table 1 cannot be explained adequately and, in fact, in most cases cannot be explained at all.

The apparent randomness of effect illustrated in table 1 is more easily understood if it is remembered that physiological action is highly dependent on details of structure. An example would be the "Lindane" series (page 109) where only the delta isomer produced an effect. Certain compounds in a group might readily produce symptoms while others, apparently close related, produce none. An example of the manner in which activity can be changed by structural variation is the following from Albert (1960): The vitamin activity of thiamine drops to 5 percent if the methyl group is removed from the pyrimidine ring, to less than 1 percent if the methyl group is removed from the thiazole ring. If an extra methyl group is inserted into the thiazole ring between nitrogen and sulfur the vitamin activity completely disappears. That there are many

physiological routes by which compounds affect fish is shown in table 1 where most unrelated groups of chemicals included one or more toxic compounds.

Despite the "confusion" resulting from lack of knowledge of the chemicals and their effects on carp, certain figures and relations pertaining to toxicity did appear. These are probably unimportant to the fields of toxicity, chemistry, and physiology but may be of interest to those contemplating screening programs of their own.

Of the 1,496 chemicals presented in table 1, only 7 percent killed all three of the fish that were initially fed large doses. This is typical of a screening program employing randomly selected compounds. Chemicals received from companies that made an effort at selection killed a slightly higher percentage of fish.

Certain large groups of compounds showed a high degree of biological activity and included the aliphatic phosphates, amine salts and phenols, the heterocyclic alkaloids, and the inorganic halogens. Groups showing little biological activity included the aliphatic carboxylates, carbamates, carbanilates, metal amine complexes, sulfides, and disulfides, and the aromatic hydrocarbons, esters, ethers, and amines. Very few chemicals killed fish at very low doses of 10 milligrams per kilogram or less.

A number of compounds that have been widely used as insecticides or rodenticides produced little or no acute effect when force-fed to carp. From the publicity these compounds have received and the furor often resulting from their improper use one would expect them to have some acute effect on carp. They include pure toxaphene, the DDT derivatives including DDT and methoxychlor, warfarin, lindane, aldrin, heptachlor, chlordane, dieldrin, pure Thiodan, parathion, and arsenic trioxide.

The great majority of lethal compounds produced only the vaguest of symptoms. Generally speaking, fish become sluggish over a period of time which varied considerably depending upon fish, chemical, and dose. Toward the end of the test period the fish turned on their sides

either at the surface of the water or the tank bottom and died. Movements during the period when the fish were affected can only be described as random. None of the 1,496 chemicals produced surfacing (as caused by certain derivatives of d-lysergic acid; (Loeb, 1962), or any positive directional movement that could be detected.

A few chemicals did produce positive symptoms. Three chemicals popularly regarded as chlorinated hydrocarbons caused alternating and long-lasting periods of irritable, erratic, and relatively normal swimming patterns. They were toxaphene (60.5 percent miscible), endrin, and Thiodan. Most lethal aliphatic phosphates caused noticeable paralysis and color changes. A few other chemicals also produced recognizable symptoms. Ephedrine, for example, caused a color loss that lasted for weeks.

Since the force-fed fish were not held for more than a few days for observation, the effects presented in this paper must be judged as acute or immediate. It is entirely possible that single doses of some of the chemicals would produce chronic symptoms, but such observations were beyond the scope of this study.

ACKNOWLEDGMENTS

The force-feeding program would not have been possible without the cooperation of many chemical companies, the United States Department of Agriculture, and Cornell University. These agencies (table 3) assembled and shipped chemicals (sometimes specially formulated for the project) free of charge for screening.

John F. LesVeaux of the Research Department of the Niagara Chemical Division, Food Machinery and Chemical Corporation, and Drs. Edwin E. Dunn and Clarence L. Moyle of the Biochemical Research Laboratory, Dow Chemical Company, provided considerable advice pertaining to handling of chemicals and screening methods.

The chemical abstracting and classifying of compounds was done by Dr. Emil J. Moriconi of Fordham University.

Kenneth F. Stafford of the Fish Laboratory demonstrated exceptional initiative in providing

thousands of large fish and maintaining the complicated facilities needed for the study.

Table 1. Screened compounds listed by arbitrary classification with results obtained by forcefeeding to carp.

The nomenclature used herein is based on the Definitive International Union of Pure and Applied Chemistry (IUPAC) 1957 Rules, and is in accord with the conventions of Chemical Abstracts. The Classification scheme, however, is our own.

All of the chemicals listed were forcefed to carp at the doses (total material without regard for formulation) shown. Effects are listed as follows: NE, no effect; S, sickness; R, recovery; D, death. All tests were carried out at temperatures of 65°F.

The Laboratory Accession Number is the number assigned to each chemical by the Fish Laboratory. Likewise many chemicals were assigned code letters and numbers by the submitters who are identified by number in Table 3.

985	777	28	soybean oils	149,155,155	NE43
1016	778	28	peanut oils	126,151,154	NE43
1030	1733	28	rape oil	109,131,179	NE66
1171	N-869	9	Structure still not proven.	62 91 219,236	NE168 S<21,R<21 D<21

Table 2. Trivial and trade names of screened compounds.

Name	Page
AEROSOL OS	105
AGERITE HIPAR	103
AGERITE HP	103
AGERITE POWDER	103
AGERITE RESIN	103
AGERITE RESIN D	106
AGERITE STALITE	103
AGERITE WHITE	103
ALDRIN	109
AMMIDIN-AMMOIDIN	89
AMMOIDIN	89
ANABASINE	68
ANHALAMINE	106
ANTHRANILIC ACID	87
AQUALIN	63
ARAMITE	46
ASPIRIN	87
BARTHANE	30
BENZIDINE	102
BENZOCAINE	92
BERGAPTEN	90
BISMATE	47
BULAN	10
BUTOBEN	90
BUTYL NAMATE	46
BUTYL ZIMATE	47

Name	Page
CACKLEBERRY	108
CAFFEINE	107
CAPRAMIDE	72
CAPTAN	73
CAPTAX	105
CHLORANIL	99
CHLORDANE	110
CHLOROBENZILATE 25W	27
CITRAZINIC ACID	87
CO-RAL	42
COUMARIN	89
CUMATE	46
DDD	14
DDT	13
DDVP	32
DNC	92
DEMETON	46
DIAZINON 25E	40
DIAZINON 25W	40
DIBROM	31
DIELDRIN	110
DIPHACINONE	64
DIPTEREX	39
DOWICIDE A	98
DOWICIDE 6	92
DOWICIDE 7	92
DRY VANCIDE 51	105

Name	Page
ENDRIN	109
EPHEDRINE	16
ETHYL TUADS	73
ETHYL ZIMATE	46
EUGENOL	92
FLUORITE	112
FUMASOL-C	89
FUNGITROL 50	25
FUNGITROL 617	98
GUTHION	42
HEPTACHLOR	110
HTH	117
INDALONE	27
KEPONE	64
KHELLIN	106
LEDATE	47
LINDANE	109
MALATHION	41
MEPHENESIN	18
METHOXYCHLOR	14
METHYL SELENAC	47
METHYL TUADS	73
METHYL ZIMATE	47
NACAP	105
NIALATE	9

Name	Page
NICOTINE	107
NICOTINE SULFATE	107
NUODEX COPPER, 8%	25
NUODEX PMA - 18	25
NUODEX ZINK, 8%	25
NUODEX 84	106
OVOTRAN	105
PARATHION	42
PHOSPHAMIDON	32
PHOSPHEN 4	38
PHOSTEX	73
PHYGON	99
PIMPINELLIN	90
PIVAL	87
PIVALYN	87
PMA	106
POLYGLYCOL 89-1	100
P-400 POLYGLYCOL	19
P-1200 POLYGLYCOL	19
PROLAN	10
QUINDEX	98
QUINDEX EMULSION BASE	98
ROTENONE CRYSTALS	87
SAFROLE	84
SAMMIDIN	89
SEVIN	50

Name	Page
SIMAZINE 50W	80
SODIUM SALT OF DIPHACINONE	64
SODIUM TCA	25
SUPER AD-IT	25
SYSTOX	46
TEDION	77
TEPP	31
TERPOSOLE NO. 8	21
THEOBROMINE	107
THIATE A	105
THIATE B	79
THIODAN	78
TOXAPHENE	9
TRIACETIN	28
2,4,5T	23
VANCIDE BL	92
VANCIDE F-2083	85
VANCIDE 26 EC	105
VANCIDE 51Z	46
VANCIDE 89	73
VANCIDE ZP	84
VANICIDE Zm	47
VANLUBE PC	92
VIOZENE	42
WARFARIN	89
WARFICIDE	89
ZETAX	105

Table 3. List of submitters of compounds, together with the submitter number.

(2)	Columbia-Southern Chemical Corporation Subsidiary of Pittsburgh Plate Glass Company Barberton, Ohio	(26)	Allied Chemical Corporation National Aniline Division 1051 South Park Avenue Buffalo 5, New York
(3)	The Dow Chemical Company Midland, Michigan	(28)	U.S. Department of Agriculture Agricultural Research Service Entomology Research Division P. O. Box 3391 Orlando, Florida
(4)	Geigy Agricultural Chemicals Division of Geigy Chemical Corporation P. O. Box 430 Yonkers, New York	(31)	Morton Chemical Company Woodstock, Illinois
(7)	Miles Laboratories, Inc. 1127 Myrtle Street Elkhart, Indiana	(34)	Shell Development Company Agricultural Research Division Post Office Box 3011 Modesto, California
(9)	Food Machinery and Chemical Corporation Niagara Chemical Division Middleport, New York	(37)	Heyden Newport Chemical Corporation 342 Madison Avenue New York 17, New York
(10)	S. B. Penick & Company 100 Church Street New York 8, New York	(38)	Nuodex Products Company A Division of Heyden Newport Chemical Corporation Elizabeth, New Jersey
(15)	Cornell University Department of Chemistry Ithaca, New York	(39)	R. T. Vanderbilt Company, Inc. 230 Park Avenue New York 17, New York
(16)	Chemical Insecticide Corporation 30 Whitman Avenue Metuchen, New Jersey	(42)	California Chemical Company Ortho Div. P. O. Box 118 Moorestown, New Jersey
(18)	Miles Chemical Company Zeeland, Michigan	(44)	Chemagro Corporation Latham Shopping Center Latham, New York
(19)	Ozark-Mahoning Company Chemical Division 310 West Sixth Street Tulsa 19, Oklahoma	(45)	Sindar Corporation Industrial Aromatics and Chemicals Delawanna, New Jersey
(20)	Allied Chemical Corporation Solvay Process Division P. O. Box 271 Syracuse 1, New York	(57)	Miscellaneous
(23)	Velsicol Chemical Corporation 330 East Grand Avenue Chicago 11, Illinois	(58)	Benzol Products Company 237 South Street Newark 5, New Jersey
(25)	Dr. Salsbury's Laboratories Charles City, Iowa	(60)	Pennsalt Chemicals Corporation 309 Graham Bldg. Aurora 7, Illinois

The Department of the Interior, created in 1849, is our Nation's Department of Natural Resources, concerned with management, conservation, and development of water, wildlife, fish, mineral, forest, and park and recreational resources. It also has major responsibilities for Indian and Territorial affairs.

As America's principal conservation agency, the Department works to assure that nonrenewable resources are developed and used wisely, that park and recreational resources are conserved for the future, and that renewable resources make their full contribution to the progress, prosperity, and security of the United States, now and in the future.

UNITED STATES DEPARTMENT OF THE INTERIOR

Stewart L. Udall, Secretary

Frank P. Briggs, Assistant Secretary for Fish and Wildlife

FISH AND WILDLIFE SERVICE

Clarence F. Pautzke, Commissioner

BUREAU OF SPORT FISHERIES AND WILDLIFE

Daniel H. Janzen, Director
